

The Company shall establish, implement, and maintain a documented process to identify workplace hazards and assess the associated OH&S risks for activities, products, and services under its control or influence. This process shall be ongoing and proactive and shall consider routine and non-routine activities, including maintenance, cleaning, start-up, shutdown, abnormal conditions, and emergency situations. The organization shall identify hazards related to its processes, equipment, materials, work environment, and work practices, including hazards that may affect employees, contractors, visitors, and other persons in or near the workplace. Worker participation shall be used during hazard identification and risk assessment to ensure practical knowledge of tasks and conditions is considered. The results shall be documented using the Hazard Assessment and reviewed periodically, as well as before new or modified activities, processes, equipment, materials, or organizational changes are introduced.

Hazard identification shall include hazards arising from work-related activities within the workplace and hazards originating outside the workplace that could adversely affect persons under the organization's control. The assessment shall address physical, chemical, biological, ergonomic, psychosocial, and safety-related hazards, and shall consider how work is organized, human factors, past incidents, potential emergency situations, contractor activities, visitor access, and changes in legal or other relevant knowledge related to hazards.

Hazard Assessment Criteria

Hazard Assessment Ranking

PROBABILITY (P)		GRAVITY (G)		MAGNITUDE (M)	
Not-Probable: Never occurred in the past. No registered events. Only a theoretical risk. It would occur only if many unpredictable and independent events will occur together.	1	Negligible: Small damage no consequence for the body. It is reasonable to predict a damage within 500 US\$	1	Very High Prevention: <u>Equipment/Technology.</u> Top Level <u>Preventive Actions.</u> Prevention automatically applied. <u>Equipment/Knowledge.</u> Good Level <u>Methods & Systems</u> Not Redundant <u>PPE.</u> Correctly used <u>Safety Records.</u> No injuries recorded <u>Skill/Awareness.</u> People own the process	1
Low: Few cases registered (one or two) due to very special reasons. The event is possible but not probable. If it would occur it would be surprising. It could cause a restricted damage only when other events will be concurrent.	3	Low: Damage with economic values between 500 and 5000 US\$. First Aid as possible consequence	3	High Prevention: <u>Equipment/Technology.</u> Technology does not allow automatic prevention <u>Preventive Actions.</u> Prevention done through procedures. <u>Equipment /Knowledge.</u> Good Level. <u>Methods & Systems</u> Not Redundant <u>PPE.</u> Correctly used <u>Safety Records.</u> No injuries recorded <u>Skill/Awareness.</u> Adequate skilled people. High level of awareness	2
High: Probable event: if it would occur it would be modestly surprising. Some events have occurred even if no consequences have been recorded.	7	High: Damage with economic values between 5000 and 50000 US\$.	7	Low Prevention <u>Equipment/Technology.</u> Not easy to upgrade the equipment to guarantee automatic prevention <u>Preventive Actions.</u> Prevention done by people with no procedures applied <u>Equipment/Knowledge.</u> Good Level	3

A damage can be procured. It is know that some events had procured consequences.		Possible injuries as consequence of the accident.		<u>Methods & Systems</u> Not Redundant <u>PPE</u> . Used as preventative countermeasure <u>Safety Records</u> . Injuries recorded <u>Skill/Awareness</u> . Adequate skilled people. High level of awareness	
PROBABILITY (P)		GRAVITY (G)		MAGNITUDE (M)	
Very High: Relevant risk for occurrence. The event will occur if appropriate preventative actions will not be taken. No surprise if the event would occur. The direct relationship between the event and the damage for people has been proven. In similar operating conditions some events already occurred.	10	Very High: Very high loss of money. Company reputation can be damaged. Risk to stop the operations. Fatal injuries possible.	10	High Prevention: <u>Equipment/Technology</u> . Not easy to upgrade the equipment to guarantee automatic prevention. <u>Preventive Actions</u> . No Prevention in place <u>Equipment /Knowledge</u> . No knowledge <u>Methods & Systems</u> Not Redundant <u>PPE</u> . Not correctly used. <u>Safety Records</u> . Injuries recorded <u>Skill/Awareness</u> . No Adequate training for people. Low level of awareness	4
