Re: Ebeni — Strain / Sprain / Soft Tissue Injury

Injury Description: Fell on ice on my knee

Dear Treating Provider,

Thank you for seeing our employee. Acme Test Facility is a partner of Core Compliance Hub (CCH) and takes workplace safety and accurate OSHA recordkeeping seriously. We are committed to ensuring our employees receive appropriate and timely medical care for all workplace injuries.

We respectfully request that, when multiple clinically appropriate treatment options exist, you consider treatment approaches that remain within the OSHA first-aid classification under 29 CFR 1904.7(a). This is not a request to withhold or delay necessary medical care — it is a request to consider first-aid-level treatment FIRST when it is clinically sufficient to treat the injury. This approach helps us maintain accurate OSHA 300 Log records and manage our recordable incident rates responsibly.

PREFERRED FIRST-AID TREATMENT OPTIONS

For this type of injury (Strain / Sprain / Soft Tissue Injury), we request that you consider the following first-aid-level treatments when clinically appropriate:

- Apply hot or cold therapy (ice packs, heating pads, warm compresses) — classified as first aid
- Use elastic bandages, wraps, or non-rigid means of support (e.g., ACE bandages, elastic knee/ankle sleeves)
- Recommend OTC anti-inflammatory medication (ibuprofen 200mg, naproxen 220mg) at non-prescription dosing
- Recommend OTC topical analgesics (e.g., Biofreeze, IcyHot, Aspercreme) for localized relief
- Provide stretching and range-of-motion exercises the employee can perform independently
- Recommend temporary activity modification with full-duty return when clinically appropriate

TREATMENTS THAT TRIGGER OSHA RECORDABILITY

Please be aware that the following treatments cross the threshold from first aid to medical treatment under 29 CFR 1904.7(a), making the case OSHA-recordable:

- Prescription muscle relaxants, prescription-strength anti-inflammatories (e.g., Meloxicam, Diclofenac), or prescription pain medications — any prescription triggers recordability
- Rigid splints, casts, or rigid braces — these constitute medical treatment and trigger recordability
- Referral to physical therapy or chiropractic treatment — these constitute medical treatment beyond first aid and trigger recordability
- Work restrictions or days away from work — these trigger recordability (if medically necessary, proceed but understand the OSHA classification impact)

CLINICAL NOTES FOR THIS INJURY TYPE

Per 29 CFR 1904.7(a), hot/cold therapy, elastic bandages/wraps, and non-prescription medications at OTC strength are first aid. Physical therapy, chiropractic treatment, prescription medications, and rigid immobilization devices are medical treatment beyond first aid.

29 CFR 1904.7(a) — FIRST AID TREATMENT SUMMARY

Under OSHA's recordkeeping standard, the following treatments are classified as FIRST AID and do NOT make a case recordable:

- ' Non-prescription medications at nonprescription strength (OTC dosing only)
- ' Tetanus immunizations
- ' Cleaning, flushing, or soaking wounds on the surface of the skin
- ' Wound coverings: bandages, Band-Aids, gauze pads
- ' Butterfly bandages, Steri-Strips, adhesive wound closure strips
- ' Hot or cold therapy (ice packs, heating pads, warm/cold compresses)
- ' Non-rigid means of support: elastic bandages, wraps, elastic sleeves
- ' Temporary immobilization devices used only during transport
- ' Drilling of fingernail/toenail to relieve pressure, draining fluid from a blister
- ' Eye patches, eye irrigation/flushing
- ' Removal of foreign bodies from the eye using irrigation or cotton swab
- ' Removal of splinters or foreign material from areas OTHER than the eye using tweezers, etc.
- ' Finger guards
- ' Massages
- ' Drinking fluids for relief of heat stress
- ' Oxygen as a first aid measure (preventive, not treatment)

We understand and respect that all treatment decisions must be based on the treating provider's clinical judgment and the best interest of the patient. We are not asking you to withhold necessary medical care. We are simply requesting that when multiple clinically appropriate treatment options exist for this injury, you consider the option that maintains first-aid classification under OSHA's regulatory framework.

If medical treatment beyond first aid is clinically necessary, please proceed with the appropriate care. We ask only that you document the clinical rationale for the treatment choice so we can accurately classify the case on our OSHA 300 Log.

Thank you for your partnership in helping us provide quality care for our employees while maintaining accurate OSHA compliance records.

Respectfully,

RAUL
